Professional Summary

Cloud & DevOps Engineer with an Engineering Diploma in Cloud Computing from ESPRIT and FinOps Certified Engineer certification. Experience in Linux production operations, Docker, Kubernetes, Helm, GitHub Actions, Java/Spring Boot development, and GCP cloud cost governance. Operates an OVHcloud-hosted business platform and contributed to approximately 10% lower monthly test-environment costs at Target Energy Solutions. Combines application troubleshooting, deployment automation, and resource monitoring to support reliable and cost-efficient operations.

Technical Skills

Cloud platforms: Google Cloud Platform (GCP), OVHcloud; additional exposure to Amazon Web Services (AWS) and Microsoft Azure.
Containers and orchestration: Docker, Docker Compose, Kubernetes, Google Kubernetes Engine (GKE), Helm.
CI/CD and Infrastructure as Code (IaC): GitHub Actions, Jenkins, Terraform modules.
Systems and automation: Linux, Bash, Python, Cloud Scheduler.
Monitoring and observability: Google Cloud Monitoring, Prometheus, Grafana.
FinOps: Billing exports, budgets, cost allocation, tagging policies, resource optimization, anomaly detection, reporting.
Application development and databases: Java, Spring Boot, Angular, React, TypeScript, MariaDB, PostgreSQL.
Web infrastructure: Nginx, reverse proxying, SSL/TLS, environment configuration, access controls.

Professional Experience

Cloud & DevOps Engineer

Université Italie Services

January 2025 – Present | Bardo, Tunisia; on-site/remote; contract

- Replaced paper-based student case management with an Angular and Java/Spring Boot platform, enabling each administrator to process 5+ additional client cases per week compared with the previous workflow.
- Centralized client records, documents, payments, and task tracking, simplifying administrative work and increasing weekly task throughput per administrator by 50% or more.
- Containerized frontend, backend, and MariaDB services with Docker Compose on an OVHcloud Linux VPS, maintaining 2 environments, staging and production, for release validation.
- Automated builds and deployments with GitHub Actions and administered Nginx, SSL/TLS, secrets, access controls, health checks, and persistent storage to support controlled production releases.

DevOps / Front-End Engineer

Jobs Hunt

August 2024 – November 2024 | Riyadh, Saudi Arabia; remote; freelance, part-time

- Delivered a responsive recruitment website in 3 languages, English, French, and Arabic, explaining company services and enabling candidates to submit job and interview requests through an online form instead of visiting the office.
- Automated production deployments with GitHub Actions so that 1 push to the main branch triggered the release pipeline, with no deployment-related downtime observed during the engagement.

Cloud FinOps Engineer

Target Energy Solutions

February 2024 – July 2024 | Lac II, Tunis, Tunisia; contract

- Built a Google Cloud Platform (GCP) FinOps framework combining billing exports, Cloud Monitoring metrics, and Google Kubernetes Engine (GKE) namespace metadata to connect costs with workload usage.
- Investigated overprovisioned workloads, including 16 vCPU allocated versus approximately 2 vCPU used, and adjusted Kubernetes requests and limits using monitoring data and Active Assist recommendations, contributing to approximately 10% lower monthly test-environment costs.
- Established tagging policies, namespace-based cost allocation, and budgets informed by observed application usage, with threshold alerts supporting spending reviews and optimization decisions.
- Used Z-Score and Isolation Forest anomaly detection to flag unusual spending and investigated a self-managed containerized database costing over £200/month. Identified a managed MySQL alternative estimated at

£10/month or less, representing approximately 95% potential savings, and documented findings in weekly reports and optimization recommendations.

DevOps Engineer
Target Energy Solutions
July 2023 – August 2023 | Lac II, Tunis, Tunisia; internship

- Deployed 3 MVP applications to a development Kubernetes cluster using reusable Helm charts and environment-specific values to support reliability testing.
- Automated application delivery with GitHub Actions and a pull-based GitOps workflow: commits to the main branch triggered deployment of newly tagged container images using the configured Helm values, reducing manual deployment steps.

Web Developer
Access Content Agency
July 2022 – August 2022 | Lac II, Tunis, Tunisia; on-site; internship

- Developed a responsive React feature integrating access to WhatsApp from the application's home page, giving clients a direct entry point to group and professional conversations.

Web Developer
Ooredoo Tunisia
February 2020 – July 2020 | Lac II, Tunis, Tunisia; hybrid; internship

- Contributed Angular and Spring features to an internal application supporting store deliveries, online orders, and inventory tracking.
- Implemented product-availability tracking to address outdated and unreliable Excel records, achieving visibility into approximately 80% of available warehouse products and supporting sales-team stock checks.

Selected Projects

Private Cloud Infrastructure – Academic Project
Technologies: OpenStack, KVM, Linux, networking, virtualization

- Assembled a private cloud from physical PCs by configuring OpenStack controller and compute resources, KVM virtualization, and networking.
- Tested and benchmarked the environment, then deployed and exposed a web application to validate delivery from physical infrastructure through application access.

FixEat – Maintenance Management Platform
Technologies: Next.js, TypeScript, Supabase, PostgreSQL, Capacitor, Android

- Developed a role-based maintenance platform with authentication, client management, equipment requests, image uploads, spare-parts tracking, and reporting using Supabase and PostgreSQL.
- Implemented a multi-stage maintenance workflow with real-time progress updates, and packaged the responsive application for Android using Capacitor to maintain a single application codebase.

Amoria AI Planner – Android Application
Technologies: Kotlin, Jetpack Compose, Firebase, Qwen3, OpenStreetMap, MVVM

- Integrated personalized activity recommendations by integrating a locally served Qwen3-4B-2507 model through LM Studio with OpenStreetMap and Overpass API location data.
- Created individual and group recommendation modes for up to five users, using preference quizzes and Firebase authentication, storage, and shared real-time data.

Education

Engineering Diploma in Cloud Computing
ESPRIT
2021 – 2024
Final grade: 18.32/20

Bachelor's Degree in Computer Science
ISET Radès
2016 – 2020

Certifications

FinOps Certified Engineer – FinOps Foundation, 2026
FinOps Foundation introductory training – 2025
